

Tasmanian Tigers.

It is known that Tasmanian tigers roamed Antarctica for over 100 years. Also, they were hunting for animals for dinner. Additionally, their favourite thing to do was run about. So actually, why are they now extinct?

Hunters think that it is an amazing thing to do which is hunting them. As a result, excessive hunting meant that their habitat was lost. Also there was no food.

Tasmanian tigers were declared to be extinct by diseases and destruction which led to a rapid extinction. Tasmanian tigers became extinct in 1986 because the food was plummeting rapidly.

Tasmanian tigers were unable to hunt for their prey, which meant no food so they would starve to death. It was also because there was no snow at all.

So that is why you can only see them in books, pictures and movies.
