

## Why Pinta Tortoises are Extinct

Pinta tortoises are now extinct and did you know that pinta tortoises could live up to 100 hundred years or over? So what caused their extinction?

The main reason pinta tortoises are extinct is because of the rats and goats. The goats ate all the food. Also the rats ate the baby tortoises.

Due to the tortoises getting killed their population got killed too but the goat population got bigger and bigger.

The only places you can see pinta tortoises now are museums, stories and films.
