

Why Polar Bears are Becoming Extinct

Polar bears have been catching fish and seals to eat. So why are they becoming extinct?

Wildlife experts have discovered that polar bears are becoming extinct because the ice is melting. If this continues they will be extinct by 2110.

The polar bears' homes are melting because the world is heating up. So that's why they are becoming extinct, so if you see them in realistic pictures, museums and films they are still not real!
