

Why are Pandas Becoming Extinct?

It is widely known that pandas live in forests, eating lots of bamboo and hunting in forests to hunt for food. Native to the mountain forests of south west China The giant panda is one of the most beloved animals in the world. So why are they becoming extinct?

There are not many pandas in the wild, in fact there are only 1,800 pandas in the wild today. This means when humans cut down trees in the forests the pandas find it hard to survive.

Pandas need to survive because we don't want them to die. Forests are being cut down so that is not good. Pandas need to keep alive and we need to stay alive too. They are losing their habitat which is not good for their health. If they lose their habitat they might die and this is so sad.

Pandas need to eat their food and survive but if they are losing their habitat, they might not survive. Because the trees are being cut down, that is not good for them or us.

You can mainly see them in picture books, documentaries and museums.
