

## Why Are White Northern Rhinos Extinct

It is a well known fact that rhinos used to roam half of Africa. They are cared for in Kenya. They eat entirely on grass because they are herbivores and they have huge mouths to eat. So why are they becoming extinct?

Their extinction is because of decades of poaching for white northern rhino's horns because if you sell them you get rich .The last male was hunted in 2018 and got shot. So there are now only two females left. Najin and Fatu are protected by armed guards so they won't get hurt.

In 2014 it became clear that the subspecies could not survive through natural breeding, so that means that both Najin and Fatu can not carry a calf to full term. Consequently, there won't be any white northern rhinos left. Did you know that white rhinos aren't white they are actually grey .

The northern rhinos are easy to hunt because they have poor eye sight also they are unfierceful so that means that the hunters can jump out and shoot .

The white northern rhinos can now only be seen in Africa, fact books or pictures .
