

Why are pandas becoming extinct?

Did you know, that up until 1891 pandas roamed Africa and across the world in nice hot places. They would never ever go to cold places because they may freeze to death and their woolly coats will not keep them warm enough. They are being destroyed due to the demands for extra lands like farms and housing.

So how can we prevent their extinction?

These pandas are getting destroyed because they are getting taken away from their habitat and being taken to zoos. They might not get fed any of their favourite food for example bamboo, grass and leaves. These animals are very easy to hunt because of their terrible eyesight and slowness of movement also their fear of humans. We are their biggest threat too.

These pandas are getting taken away and are struggling to have new born. This causes less pandas to live. There are only 1800 left in the world. It is not nice that these owners are taking animals out of their habitat and it is just to make more money. It is not good for their population. Pandas are dying because of global warming, which changes their climate. Also, some people around the world cause deforestation.

These animals are trapped because we are destroying their plant. Consequently, it leaves less room for wildlife especially pandas and other animals. Only a few pandas are now living in the wild, they are getting taken, they are in danger. It is your chance to help them. We never know when these pandas will die, they may only have a week left?

These poor pandas can only be seen in zoos, books, films and movies.
